

Aquablation therapy is a new surgical treatment for Benign Prostatic Hyperplasia (BPH). Delray Medical Center is proud to offer this advanced, minimally invasive treatment to the community.

BPH, or an enlarged prostate, is a noncancerous condition where the prostate grows larger than average. If left untreated, BPH can cause significant health problems, including irreversible bladder or kidney damage, bladder stones and incontinence.

Aquablation therapy includes:

- An advanced, minimally invasive treatment that uses the power of water delivered with robotic precision to provide best-in-class and long-lasting symptom relief.
- A resective procedure to surgically remove the prostate tissue causing symptoms. No incision is made in the abdomen, as the procedure reaches the prostate through the urethra.
- An AquaBeam Robotic System, the first FDA-approved, surgical robot utilizing automated tissue resection for the treatment of lower urinary tract symptoms (LUTS) due to BPH.
- Low rates of irreversible complications, regardless of prostate size or shape.
- A safe and effective treatment for BPH patients suffering from lower urinary tract symptoms that affect the bladder, prostate and urethra and impact the ability to hold urine and empty the bladder.
